Brazil protects part of the Amazon rain forest.

The Amazon rain forest is the world's largest tropical rain forest. It covers about 2 million square miles—roughly two-thirds the size of the United States. The map shows the location of the Amazon rain forest and its newly protected areas.

Baker Vail

Jaguars and anteaters in northern South America can rest easy. A section of the Amazon rain forest as big as Illinois was recently placed under government **protection**<sup>1</sup>. The land in Brazil links to protected areas in other South American countries, including Guyana, Suriname, and French Guiana.

In total, these protected forests cover nearly 58,000 square miles. The land also contains more than 25 percent of the world's **tropical rain forests**. A tropical rain forest is a **dense**<sup>2</sup> forest in a warm region that gets at least 100 inches of rainfall a year.

Environmentalists from the group Conservation International say this area of the northern Amazon has more **biodiversity** than all tropical forests on the planet. Biodiversity is the **variety** of plants and animals in an environment. The Amazon is home to more **species**, or types, of plants and animals than any other place in the world.

## A Forest in Danger

Since 1970, more than 232,000 square miles of the Amazon rain forest have been destroyed. That is nearly the size of Texas! The destruction has **endangered**<sup>3</sup> many animal species. Experts predict that the continued **deforestation**, or clearing of trees, at this rate would endanger the entire region by 2050.

<sup>1</sup> **protection**: the act of guarding or shielding from something that would cause destruction

<sup>2</sup> **dense**: thick

<sup>3</sup> **endangered**: threatened with extinction (all members of a species dying)

Officials were especially concerned about **preserving**<sup>4</sup> the forests. Part of the area is believed to contain more than half of all bird, animal, and plant species found in the Amazon.
